# THE MOPAR® ADVANTAGE

## ELECTRONIC ENGINE CONTROLLER

# ELECTRONICS TROUBLESHOOTING GUIDE

## SINGLE MODULE ENGINE CONTROLLER

Model Year 1988–1989

### The following are often misdiagnosed as defective SMEC/SBEC units:

- Intermittent grounds: Loose or corroded grounds may cause false sensor readings.
- Auto-shutdown (ASD) relay: Corroded wires or faulty relay.
- Manifold Absolute Pressure (MAP) sensor and Throttle Position Sensor (TPS) voltages: Check voltages over the entire range, not just the extremes. Verify minimum TPS voltage.
- Minimum air flow: Check for air leaks or airflow obstruction.

- Automatic Idle Speed (AIS) motor: Shorted windings will set DTSs. Open circuits and intermittent connections will not.
- Vacuum system: Contaminants or leaks in vacuum lines, notably in line connected to MAP sensor can set MAP pneumatic Fault #13.
- Fuel pressure and leak down.
- Vehicle speed sensor operation.
- Heater voltage for oxygen sensor.
- Charging system malfunction: Alternator defective or battery not fully charged will set faults.

## SINGLE BOARD ENGINE CONTROLLER

Model Year 1989–1991 SBEC

Model Year 1992–1995 SBECII

- Crankshaft and camshaft sensors: Some aftermarket pickups have not worked properly with Mopar engine controllers.
- Check for high circuit resistance associated with splices and fusible links; check for open and/or shorted wires.
- Closed throttle switch operation on AB, AD, AN bodies, '88–91 MY. TBI Dodge Trucks only.
- Damaged connector terminals: Remove orange gasket from bottom of SMEC/SBEC 60-way connector, reseat connector, and check for symptom/problem. If symptom/problem has been corrected, check 60-way harness and/or connector for terminal damage or loose connection. Wiring harness pin diameter should be .055". Use the male terminals on your PCM as a gauging tool.

- Excessive current on certain connector pins may damage the SMEC/SBEC. Use of a test lamp or a short in the wiring harness of the vehicle can cause this condition. Always use a DVM when checking the unit/system.
- Check Technical Service Bulletins applicable to model year and system malfunction.
- Dirty or carboned throttle bodies are often misdiagnosed as PCM or fuel delivery problems.

Model Year 1996–2003 SBEC III / IIIA / IIIB

- Vehicle Identification Number (VIN) and the vehicle's original mileage must be entered into the PCM to avoid drivability problems and erroneous diagnostic trouble codes. If you are not using a DRB III, please check with your scan tool manufacturer to verify you have the capability to enter this information.
- Crankshaft and camshaft position sensors: Some aftermarket pickups have not worked properly with Mopar engine controllers.
- Check for high circuit resistance associated with splices and fusible links; check for open and/or shorted wires.
- Damaged connector terminals: Visually inspect both 40-way connectors for terminal damage.

- Excessive current on certain connector pins may damage the SBEC. Use of a test lamp or a short in the wiring harness of the vehicle can cause this condition. Always use a DVM when checking the unit/system.
- Check Technical Service Bulletins applicable to model year and system malfunction.
- Dirty or carboned throttle bodies are often misdiagnosed as PCM or fuel delivery problems.
- Loose timing belts or belts that have jumped a tooth can also be misdiagnosed as PCM or camshaft/crankshaft position sensor problems.

### IMPORTANT!

#### MOPAR® REMANUFACTURED SINGLE BOARD ENGINE CONTROLLER (SBEC III)

WARNING: Use the DRB scan tool to reprogram the replacement SBEC III (PCM) with the vehicle's original identification number (VIN) and the vehicle's original mileage. Failure to do so may cause idling and/or drivability problems and may set a diagnostic trouble code (DTC).

# ELECTRONICS TROUBLESHOOTING GUIDE

(CONTINUED)

## SPARK CONTROL COMPUTERS

Model Year 1978–1989

### ***The following are often misdiagnosed as defective SCC:***

- Charging system malfunction: Alternator defective or battery not fully charged. NOTE: SCC does not control charging system in carbureted vehicles. There is an external voltage regulator.
- Vacuum systems: Contaminants or leaks in vacuum lines, notably in line connected to transducer on SCC.
- Pin connections: Harness connector pins to SCC or sensors spread apart or corroded, causing open or intermittent connections.
- Secondary ignition: Aftermarket replacement parts not in specification with OEM. Example: Spark plug wire resistance or wire length.
- Exhaust system: Catalytic converter malfunctioning or clogged.

- Magnetic pickups: Check air gap and resistance of pickup(s). Some aftermarket pickups have not worked properly with Mopar engine controllers.
- Excessive current on certain connector pins may damage the SCC. Use of a test lamp or a short in the wiring harness of the vehicle can cause this condition. Always use a DVM when checking the unit/system.
- Check Technical Service Bulletins applicable to model year and system malfunctions.

## TBI/TURBO POWER AND LOGIC MODULES

Model Year 1984–1987

### ***The following are often misdiagnosed as defective TBI/Turbo Modules:***

- Charging system malfunction: Alternator defective or battery not fully charged. NOTE: In 1985 and later vehicles, the voltage regulator is controlled by BOTH the Logic and Power modules. In many vehicles, the voltage regulator is in the alternator.
- Verify model year of vehicle electronics: Some 1987 P-bodies with turbocharged engines were built with 1986 logic modules. A 1986 logic module can be identified by the MAP sensor mounted on the logic module case, unless TSB #18-03-86 has been performed. Then, the MAP sensor is separate. The 1987 logic modules used MAP sensors mounted in the engine compartment.
- Intermittent grounds: Loose or corroded grounds may cause false sensor readings.
- Loose or corroded pin connections: Water leakage through kick panel may cause logic module pins to corrode.

- Manifold Absolute Pressure (MAP) and Throttle Position Sensor (TPS) voltages: Check voltage over the entire range, not just the extremes. Verify minimum TPS voltage.
- Auto-shutdown (ASD) relay operation: Verify distributor connections and proper voltages. Some aftermarket pickups have not worked properly with Mopar engine controllers.
- Automatic idle speed (AIS) motor: Shorted windings will set DTCs. Open circuits and intermittent connections will not.
- Vacuum system: Contaminants or leaks in vacuum lines, notably in line connected to MAP sensor.
- Excessive current on certain connector pins may damage the modules. Use of a test lamp or a short in the wiring harness of the vehicle can cause this condition. Always use a DVM when checking the unit/system.
- Check Technical Service Bulletins applicable to model year and system malfunction.

## MOPAR® REMANUFACTURED ELECTRONIC AUTOMATIC TRANSAXLE CONTROLLER (EATX II)

### Transaxle Quick Learn Procedure

- This program allows the electronic transaxle system to recalibrate itself to provide the best possible transaxle operation. The Quick Learn procedure should be performed if any of the following actions have been implemented:
- Transaxle assembly replacement
- Transmission control module replacement
- Solenoid pack replacement
- Clutch plate and/or seal replacement
- Valve body recondition or replacement

This procedure must be performed if the transmission control module has been replaced.

Failure to perform this procedure will result in a "NO SPEEDOMETER OPERATION" condition.

### EATX II Troubleshooting Tips

- For vehicles that have both a limp-in condition and a no communication with scan tool problem, the EATX II relay may be at fault. Swap the backup lamp relay with the EATX II relay to verify. If the limp-in and no communication problem go away then replace the defective relay.
- No speedometer operation after EATX II module replacement: See the pinion factor procedure.
- Certain fault codes are caused by internal transmission problems, but replacing the EATX II module will not fix these problems. Reference the installation booklets for more information.

## MOPAR® REMANUFACTURED BENDIX ABX-4 ANTILOCK BRAKE CONTROLLER

### Removal and Installation Instructions

#### IMPORTANT!

**WARNING:** If a new Controller Antilock Brake (CAB) is being/has been installed, it must be initialized prior to driving the vehicle. The CAB is initialized using the DRB scan tool and the initializing procedure described upon selecting Bendix ABX-4 diagnostics. New controllers are programmed to flash the ABS Warning Lamp until unit initialized by the installing technician.

#### Intermittent Diagnostic Trouble Codes

As with virtually any electronic system, intermittent faults in the ABS system may be difficult to accurately diagnose.

Most intermittent faults are caused by faulty electrical connections or wiring. When an intermittent fault is encountered, check suspect circuits for:

1. Poor mating of connector halves or terminals not fully seated in the connector body.
2. Improperly formed or damaged terminals. All connector terminals in a suspect circuit should be carefully reformed to increase contact tension.
3. Poor terminal-to-wire connection. This requires removing the terminal from the connector body to inspect.

4. Pin presence in the connector assembly.
5. Proper ground connections. Check all ground connections for signs of corrosion, tight fasteners, or other potential defects. Refer to wiring diagram manual for ground locations.
6. If a visual check does not find the cause of the problem, operate the car in an attempt to duplicate the condition, and record the fault code.
7. Most failures of the ABS system will disable ABS function for the entire ignition cycle even if the fault clears before key-off. There are some failure conditions, however, which will allow ABS operation to resume during the ignition cycle in which a failure occurred if the failure conditions are no longer present. The following conditions may result in intermittent illumination of the ABS warning lamp. All other failures will cause the lamp to remain on until the ignition switch is turned off. Circuits involving these inputs to the (CAB) should be investigated if a complaint of intermittent warning system operation is encountered.
8. Low system voltage. If Low System Voltage is detected by the CAB, the CAB will turn on the ABS warning lamp until normal system voltage is achieved. Once normal voltage is seen at the CAB, normal operation resumes.
9. Additionally, any condition which results in interruption of electrical current to the CAB or modulator assembly may cause the ABS warning lamp to turn on intermittently.

(CONTINUED)

## Important

Before attempting any repairs, you should refer to 42RE Transmission Powertrain Diagnostic Procedures Manual #81-699-94019. This manual is available through your local Chrysler, Jeep®, or Dodge dealer.

### Notice: Before Replacing TCM

Use the DRB scan tool to diagnose TCM Function whenever a fault is suspected. Replace the module ONLY when scan tool diagnosis indicates a fault has actually occurred.

### 42RE Transmission Diagnosis

Always begin transmission diagnosis by checking the easily accessible items such as fluid level, fluid condition and throttle cable/shift linkage adjustments. A road test will determine if further diagnosis is necessary. Procedures outlined in this section should be performed in the following sequence to realize the most accurate results:

1. Preliminary diagnosis
2. Fluid level and condition
3. Leak test (if fluid level is low)
4. Linkage adjustment
5. Overdrive control switch test
6. Road test
7. Stall test
8. Hydraulic pressure test
9. Air pressure test
10. Analyze test results and consult diagnosis charts

**Note:** Before replacing any damaged component, you should always first determine what caused the component to fail and repair that before continuing. Static electricity can damage electronic components. By following a few safety procedures, you can reduce the risk of damage from static electricity.

1. Avoid contact with the electrical connectors.
2. Discharge any static electricity that you may have developed by frequently touching a known good ground during installation.

### Common Failures That Cause Misdiagnosis of FCCs

- Intermittent, loose or corroded grounds may cause false sensor readings. Verify all sensor grounds terminate at FCC 60-way connector, pin 51 (BK/DG) for FJ and F24S Body, or (BK/LB) for PL Body.
- Manifold Absolute Pressure (MAP) sensor and Throttle Position Sensor (TPS) voltages. Check voltage over the entire range, not just the extremes. Whenever possible, use the oscilloscope to check MAP and TPS sensor output voltages for noise spikes.

Verify minimum TPS voltage. Minimum TPS voltage should be approximately 0.5 to 1.5 VDC.

- Shorted windings or intermittent connections in Automatic Idle Speed (AIS) motor. If AIS codes are present, check to ensure motor windings or related connectors are not shorted to ground.
- Heater voltage for upstream and downstream oxygen sensors. Verify battery volts +/- 1 volt at upstream oxygen sensor connector, pin 4 (BK/RD) FJ and F24S Body, or (DG/OR) PL Body. Verify same voltage at downstream oxygen sensor connector, pin 4 (BK/RD) FJ and F24S Body, or (DG/OR) PL Body.

## MOPAR® REMANUFACTURED 2RE TRANSMISSION CONTROL MODULE (TCM)

### Removal and Installation Instructions

#### Preliminary Diagnosis

Two basic procedures are required. One procedure for vehicles that are drivable, and an alternate procedure for disabled vehicles (will not back up or move forward).

#### Drivable Vehicle

1. Check for TCM fault codes with DRB scan tool, or with fault flash codes at lamp in overdrive OFF switch.
2. Check fluid level and condition.
3. Adjust throttle and gearshift linkage if complaint was based on delayed, erratic or harsh shifts.
4. Road test and note how transmission upshifts, downshifts and engages.
5. Perform stall test if complaint based on sluggish acceleration or if an abnormal throttle opening is needed to maintain normal speeds with a properly tuned engine.
6. Perform hydraulic pressure test if shift problems were noted during road test.
7. Perform air pressure test to check clutch-based operation.

#### Disabled Vehicle

1. Check fluid level and condition.
2. Check for broken, disconnected, binding throttle valve cable or lever.
3. Check for cracked, leaking cooler lines, or loose, missing pressure point plugs.
4. Raise vehicle, start engine, shift transmission into gear, and note the following:
  - A. If propeller shafts turn but wheels do not, problem is with differential or axle shafts.
  - B. If propeller shafts do not turn and transmission is noisy, stop engine. Remove oil pan and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump or input shaft.
  - C. If propeller shafts do not turn and transmission is not noisy, perform hydraulic pressure test to determine if problem is of a hydraulic or mechanical origin.

## FOUR-CYLINDER CONTROLLERS (FCC)

- Charging system malfunction. Alternator defective or battery not fully charged. Check alternator output to ensure there is not excessive ripple voltage.
- Sensor voltage supply. Check for approximately 5-volt output from 60-way FCC connector pin 43 (DG/YL) FJ and F24S Body, or (VT/WT) PL Body to MAP and TPS sensor, with ignition switch on.
- Distributor voltage supply. Check for approximately 8 to 9-1/2 VDC output from 60-way FCC connector pin 44 (YL) FJ and F24S Body, or (OR) PL Body to distributor connector(s) with ignition switch on and while cranking.

#### Other Things to Consider

- Auto-shutdown (ASD) relay. Corroded wires or faulty relay.
- Minimum air flow. Check for air leaks or airflow obstruction.
- Vacuum system. Contaminants or leaks may be in the vacuum lines.
- Fuel pressure and leak down.
- Vehicle speed sensor operation.
- Crankshaft and camshaft sensors. Some aftermarket sensors have not worked properly with Mopar remanufactured engine controllers.
- Splices and fusible links. Check for open and/or shorted wires.
- Damaged connector terminals. Remove gasket from FCC 60-way connector, reseat connector, and check for symptom/problem. If system/problem has been corrected, check 60-way harness and/or connector for terminal damage or loose connection.
- Excessive current on certain connector pins may damage the FCC. Use of a test lamp or a short in the wiring harness of the vehicle can cause this condition. Always use a DVM when checking the unit/system.
- Check Technical Service Bulletins according to model year and system malfunction.

*Note: The photos shown on this page may not be representative of the actual part.*

## JEEP® TRUCK ENGINE CONTROLLER (JTEC)

### COMMON FAILURES THAT CAUSE MISDIAGNOSIS OF JTECs

- Intermittent grounds, loose or corroded grounds may cause false sensor readings. Verify all sensor grounds terminate at JTEC connector A (black), pin 4.
- Manifold Absolute Pressure (MAP) sensor and Throttle Position Sensor (TPS) voltages. Check voltage over the entire range, not just the extremes. Whenever possible, use an oscilloscope to check MAP and TPS sensor output voltages for noise spikes.
- Verify minimum TPS voltage. Minimum TPS voltage should be approximately 0.5 to 1.5 VDC.
- Shorted windings or intermittent connections in Automatic Idle Speed (AIS) motor. If AIS codes are present, check to ensure motor windings or related connectors are not shorted to ground.
- Charging system malfunction. Alternator defective or battery not fully charged. Check alternator output to ensure there is not excessive ripple voltage.
- Sensor voltage supply. Check for approximately 5 VDC output from connector A (black), pin 17 and from connector B (white), pin 31 to corresponding sensors (MAP, TPS, cam, crank, trans pressure) with ignition switch on.

#### Other Things to Consider

- Auto-shutdown (ASD) relay. Corroded wires or faulty relay.
- Minimum airflow. Check for air leaks or airflow obstruction.
- Vacuum system. Contaminants or leaks may be in the vacuum lines.
- Fuel pressure and leak down.
- Vehicle speed sensor operation.
- Crankshaft and camshaft sensors. Some aftermarket sensors have not worked properly with Mopar remanufactured engine controllers.
- Splices and fusible links. Check for open and/or shorted wires.
- Damaged connector terminals.
- Excessive current on certain connector pins may damage the JTEC. Use of a test lamp or a short in the wiring harness of the vehicle can cause this condition. Always use a DVM when checking the unit/system.
- Check Technical Service Bulletins according to model year and system malfunction.

#### IMPORTANT!

#### MOPAR® REMANUFACTURED JEEP® TRUCK ENGINE CONTROLLER (JTEC)

Warning: Use the DRB scan tool to reprogram the replacement JTEC with the vehicle's original identification number (VIN) and the vehicle's original mileage. Failure to do so may cause idling and/or drivability problems and may set a diagnostic trouble code (DTC).

It is important to note that this publication contains various cautions and warnings. These should be carefully read in order to minimize the risk of personal injury or the possibility that improper service methods may damage the vehicle or render it unsafe. It is important to note that these cautions and warnings cover only the situations and procedures encountered and recommended by Chrysler LLC. Chrysler LLC could not possibly know, evaluate, or advise the service trade of all conceivable ways that service may be performed, or of the possible hazards of each. Consequently, Chrysler LLC has not undertaken any such broad service review. Accordingly, anyone who uses a service procedure or tool that is not recommended in this publication must assure oneself thoroughly that neither personal safety, nor vehicle safety, be jeopardized by the service methods they select.

## PRODUCT FEATURES:

- New bearings
- New brushes
- New slip ring assembly (when necessary)
- New positive and negative heat sinks
- Load tested to Chrysler LLC specifications

All other parts are cleaned with an environmentally sound, recyclable aqueous cleaning system. Inner parts are tested to ensure they meet O.E. specifications.

## EAGLE/AMC PASSENGER CARS

MODEL YEAR	APPLICATION	O.E. PART NO.	REMAN PART NO.
1987-1972	All AMC 6-cyl.	J5752791	JR775001
1986-1983	All AMC 2.5L (carb. only)	J3242283	JR775012
1979-1972	All AMC V8	J5752791	JR775001

Note: In some early versions of the 1985 1.7L engine, a unique engine block was used that caused tight clearances between the engine block and the starter field housing. This block uses a starter motor with a flat cut on the field housing on the side toward the engine block. In addition to the cut, this modified starter has a daub of green paint on the drive housing. When replacing this type of starter, refer to the 1985 Jeep®/Eagle Parts Catalog.

# DISTRIBUTORS

## PRODUCT FEATURES:

- New Bushings
- New Nylon Gears
- New Roll Pins
- New Gaskets
- New Oil Felts
- New O-rings

Each distributor is fully tested and calibrated to Chrysler LLC specifications.

# BACKLITE WIPER MOTORS

## PRODUCT FEATURES:

- 100% new brushes, brush springs, circuit breakers, gaskets and O-rings
- Drive gears, armature, bushings, permanent magnet field remanufactured to Chrysler LLC standards
- Armatures are rewound to O.E. specifications
- Tested for proper current, ground and contact
- Fully computerized testing and measurement system ensures proper functioning of the motor

# FOUR CYLINDER CONTROLLERS

## PRODUCT FEATURES:

- Engine controller for 2.0L 4-cylinder engine
- First powertrain control module (PCM) to contain the new OBDII emissions diagnostic system
- Utilizes "Task Manager" software
- Each unit is tested to meet O.E. specifications using the same series of tests as new parts
- Faulty components are replaced with new
- Unit is fully resealed

<sup>1</sup>Emissions recall #7671 must be completed on vehicle prior to installing module.

<sup>2</sup>Emissions recall #7672 must be completed on vehicle prior to installing module.

<sup>3</sup>Without emissions recall #7671 and #7672.

# SINGLE BOARD ENGINE CONTROLLERS (SBEC)

## PRODUCT FEATURES:

- Preprogrammed, digital computer—adjusts air-fuel ratios, ignition timing, and alternator charge rate for optimal performance
- Self-tests many input and output circuits
- Faults stored in memory—accessed by Diagnostic Readout Box III (DRBIII®)

# SINGLE BOARD ENGINE CONTROLLERS (SBECIII)

## PRODUCT FEATURES:

- The Powertrain Control Module is a digital computer containing a microprocessor.
- Utilizes On-Board Diagnostics (OBDII) to aid in powertrain diagnosis.
- EEPROM (Electrically Erasable Programmable Read Only Memory) allows the module to be updated with the latest revision of on-board operating software. This ensures that all reman modules are upgraded to the latest revision.
- Adjusts fuel injector pulse width, idle speed, ignition timing and canister purge based on inputs it receives.
- Regulates cooling fans, air conditioning and speed control systems based on inputs it receives.
- Changes generator charge rate by adjusting the generator field as required.
- Tech note: VIN and vehicle mileage must be programmed into module prior to road use.

# VIPER/TRUCK/JEEP® ENGINE CONTROLLERS (JTEC)

## PRODUCT FEATURES:

- Engine controller for Jeep® vehicles, Truck and Viper
- Contains OBDII emissions diagnostic system
- Reflash capability for easy software upgrades using DRBIII
- Each unit is tested to meet O.E. specifications using the same series of tests as new parts
- Faulty components are replaced with new
- Unit fully resealed

# SPARK CONTROL COMPUTERS (SCC)

## PRODUCT FEATURES:

- Calculate optimal air/fuel mixture
- Provide variable advance curves
- Retard sensor timing for peak engine performance

## PASSENGER CARS

# ELECTRONIC AUTOMATIC TRANSAXLE (EATX)

## PRODUCT FEATURES:

- Aids PCM in Torque Management, prolonging the life of drivetrain components
- Utilizes On Board Diagnostics (OBDII), aiding in transaxle diagnosis
- Includes self-diagnostic functions to test condition of electronic controls
- Continuously monitors critical functions and records any malfunctions
- Pinion Factor compensates for different tire sizes and final drive ratios
- Limp-In mode prevents damage to transmission if fault is detected

# JEEP® TRANSMISSION CONTROLLERS

## PRODUCT FEATURES:

- The 42RE control module is a digital computer containing a microprocessor
- Controls operation of the converter clutch, overdrive clutch and governor pressure solenoid
- Determines transmission shift points based on various inputs from vehicle sensors
- Diagnostic capability to check operation of the control module and transmission electrical components

JEEP®

MODEL YEAR	APPLICATION	TRANS.	O.E. PART NO.	REMAN PART NO.
1995-1994	ZJ Body 4.0L	42RE	56027564	R6027564

# DIESEL HEATER CONTROL MODULE

## PRODUCT FEATURES:

- The module is designed to aid starting in cold weather
- Reduces white smoke by heating the intake air flow
- Monitors intake manifold temperature to ensure accuracy of heating cycles
- Monitors crank conditions to ensure manifold heaters do not come on at incorrect engine conditions
- Illuminates warning lamp on dash if water in fuel is detected

## DIESEL APPLICATIONS

MODEL YEAR	APPLICATION	O.E. PART NO.	REMAN PART NO.
1995-1989	AD Body 5.9L Diesel	04429546	R4429546

Note: Covered by Mopar's 12-month/12,000 mile warranty

# ABS ELECTRONIC CONTROLLERS

## PRODUCT FEATURES:

- Delivers the same reliability as the original equipment module to prevent lockup under heavy braking conditions at speeds above 3 mph.
- Enhanced diagnostic capability through the use of microprocessor technology. The module monitors critical input and output circuits within the ABS system of the vehicle, making sure they are operating correctly.
- Each Reman module goes through rigorous inspection and testing processes. The same test equipment that was utilized for the O.E. module is used for Reman. Each module is tested in an automated test temperature chamber for 6–8 hours.
- The module is temperature cycled from -40° C to 105° C multiple times. This ensures that each module is functionally tested under extreme operating conditions multiple times.
- The module is encapsulated in the housing and tested one final time before the Mopar Reman label is applied.
